

DPM easyCipher Agent for Windows

Updates in DPM easyCipher Agent version 2.8.8.0

Release date: 1-Sep-2023

The following changes have been performed since v2.8.7.0 of DPM easyCipher Agent for Windows:

New features:

1. Migration utility can be executed from a command line or scripts

Improvements:

1. After a key is changed in the policy, old files can continue to use the old key and new files will use the new key. No need to decrypt all files before changing a key in the policy.
2. After key is revoked for the folder, the files that are already encrypted can be decrypted and encrypted using the existing key. The revoked key cannot be used for new files.
3. Fixed the issue when if a key is destroyed for a folder policy, it will block other policies. Now only the policy for a destroyed key is skipped and other policies will be applied as normal.
4. Fixed the issue of incorrect decryption after offline password change.
5. Initialize by zero when end of file is extended.
6. Fixed the issue of data mismatch when read is done with a file handle opened with caching disabled, and the write was done with a file handle opened with caching enabled.
